

SOLUTION OVERVIEW

OpenText Axcelerate Automated Translation

Automatically translate documents into English through a secure, API-driven integration with Veritone aiWARE

Versatile: Automate best-in-class translations for 29 languages including CJK

Simple: Seamlessly manage translation jobs inside of OpenText™ Axcelerate™

Secure: Only extract text; native files stay within client environment

Efficient: Speed up workflows by reviewing files directly in Axcelerate

Global litigation and commerce are multilingual, but reviewing those documents for eDiscovery, compliance or investigation purposes is cumbersome and time-consuming. Non-English documents must be isolated and batched to specially retained native speaking document reviewers at an exorbitant cost. This slows down the review and analysis process and injects uncertainty into the equation. How can review managers be confident that human translators are translating consistently? With no audit trail or evidence of interpretation, manual translation is a black box of risk.

Automating the translation process with a consistent, machine-powered translation engine streamlines document review, reduces costs and standardizes interpretations. OpenText™ Axcelerate™ simplifies the handling of multilingual documents through an integration with the Veritone aiWARE™ proprietary AI operating system. The application program interface (API) powered integration extracts text from selected documents, securely sends it to aiWARE for translation and then automatically returns the translated text for review.

Identify and translate

Identify and translate 29 different languages into English. Machine-powered translations are consistent, secure and automated, eliminating inconsistencies among human translators. aiWARE’s specialized machine learning algorithms dramatically increase the accuracy of translated output.

Simple and seamless

Axcelerate’s Smart Filters automatically detect and categorize text according to language, making it easy to identify batches for translation. Once a document or batch of documents have been identified for review, a simple “Send to Veritone” action button is all review teams need to kick off a translation job. The machines take care of the rest.

Secure and confidential

An API powers the Axcelerate-Veritone integration, ensuring that data is securely transferred from application-to-application without any exposure to intermediaries or third-parties. Axcelerate and Veritone both leverage AWS for a true cloud-to-cloud transfer. Only the extracted text is transferred, never native files.

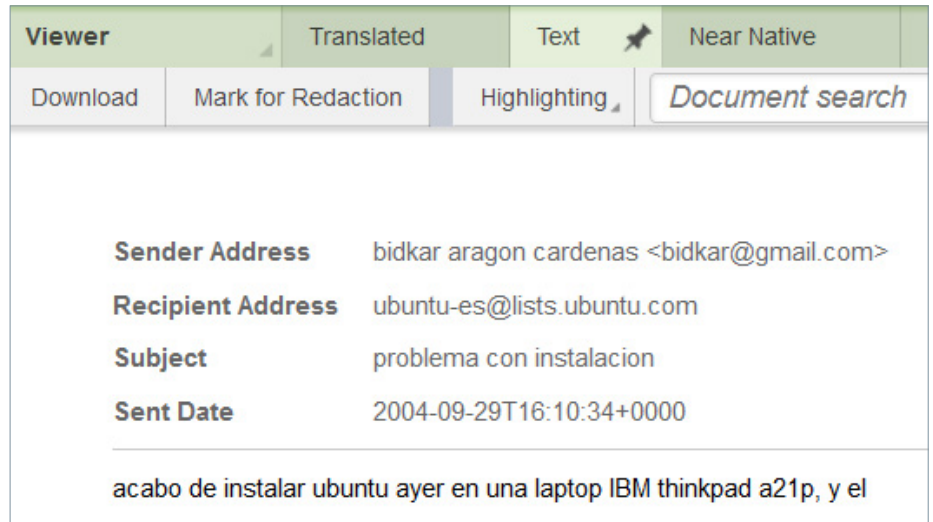

- Axcelerate includes the Veritone API integration at no additional cost.

Text-to-text languages supported	
Source language	Destination language

Translation

1 of 1 selected document will be translated to English

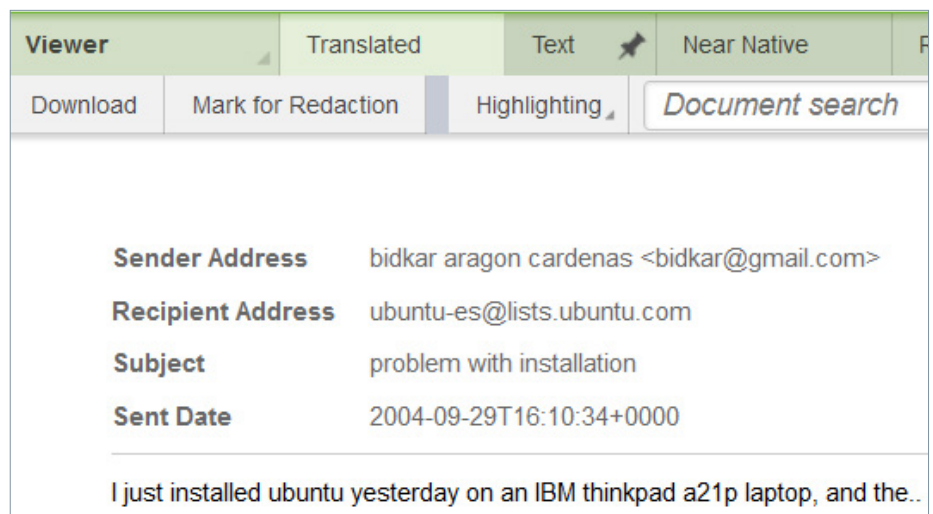

- 0 of 1 document will be excluded from translation
 - 0 documents have no text or language cannot be identified
 - 0 are in English and do not need translation
- 0 documents were previously translated
 - Include previously translated documents

Selected documents once submitted will leave this environment and be sent to the site of a third-party translation service provider identified by your administrator, for translation at an additional cost and per the terms of the provider. OpenText has no obligation regarding the data once you send the documents for translation services.

By clicking "Submit", I acknowledge that I am authorized by the company using the services to agree and I agree with the statement above.
